INVITED SPEAKERS

Colin Atkinson  
Mannheim University  
Germany

Dimitri Konstantas  
University of Geneva  
Switzerland

Michael Papazoglou  
University of Tilburg  
The Netherlands

Alexander Verbraeck  
Delft University of Technology  
The Netherlands

SPECIAL SESSION CHAIRS

SPECIAL SESSION ON GLOBAL SOFTWARE DEVELOPMENT: CHALLENGES AND ADVANCES
Aurora Vizcaíno, Universidad de Castilla-La Mancha, Spain
Gabriela Aranda, Universidad del Comahue, Argentina

SPECIAL SESSION ON APPLICATIONS IN BANKING AND FINANCES
Damir Kalpic, Department of Applied Computing, Faculty of Electrical Engineering and Computing, Croatia

SPECIAL SESSION ON METAMODELLING – UTILIZATION IN SOFTWARE ENGINEERING (MUSE)
Cesar Gonzalez-Perez, IEGPS, CSIC, Spain
Brian Henderson-Sellers, University of Technology, Australia

TUTORIALS

CRYPTOGRAPHIC FEATURES, APPLICATIONS: JAVA (C)
Ray Kresman, Bowling Green State University, U.S.A.
CONFERENCE CO-CHAIRS
José Cordeiro, Polytechnic Institute of Setúbal / INSTICC, Portugal
Alpesh Kumar Ranchordas, INSTICC, Portugal

PROGRAM CO-CHAIRS
Markus Helfert, Dublin City University, Ireland
Boris Shishkov, University of Twente / IICREST, The Netherlands

PROCEEDINGS PRODUCTION
Helder Coelhas, INSTICC, Portugal
Vera Coelho, INSTICC, Portugal
Andreia Costa, INSTICC, Portugal
Bruno Encarnação, INSTICC, Portugal
Bárbara Lima, INSTICC, Portugal
Vitor Pedrosa, INSTICC, Portugal
Vera Rosário, INSTICC, Portugal
José Varela, INSTICC, Portugal

CD-ROM PRODUCTION
Paulo Brito, INSTICC, Portugal

WEBDESIGNER
Marina Carvalho, INSTICC, Portugal

GRAPHICS PRODUCTION
Helder Coelhas, INSTICC, Portugal

SECRETARIAT AND WEBMASTER
Mónica Saramago, INSTICC, Portugal
PROGRAM COMMITTEE

Jemal Abawajy, Deakin University, Australia
Silvia Abrahão, Universidad Politécnica de Valencia, Spain
Muhammad Abulaish, Jamia Millia Islamia (Central University), India
Hamideh Afsarmanesh, University of Amsterdam, The Netherlands
Jacky Akoka, CNAM & INT, France
Markus Aleksy, ABB Corporate Research Center, Germany
Daniel Amyot, University of Ottawa, Canada
Tsanka Angelova, Unicord Ltd, Bulgaria
Keijiro Araki, Kyushu University, Japan
Alex Aravind, University of Northern British Columbia, Canada
Farhad Arbab, CWI and Leiden University, The Netherlands
Cyrille Artho, National Institute of Advanced Industrial Science and Technology, Japan
Colin Atkinson, University of Mannheim, Germany
Rami Bahsoon, The University of Birmingham, U.K.
Mortaza S. Bargh, Telematica Instituut, The Netherlands
Joseph Barjis, University of Wisconsin - Stevens Point, U.S.A.
Bernhard Bauer, University of Augsburg, Germany
Bernhard Beckert, University of Koblenz, Germany
Noureddine Belkhatir, LSR-IMAG University of Grenoble, France
Fevzi Belli, University Paderborn, Germany
Alexandre Bergel, INRIA Futurs, France
Árpád Beszédes, University of Szeged, Hungary
Maarten Boasson, University of Amsterdam, The Netherlands
Wladimir Bodrow, University of Applied Sciences Berlin, Germany
Marcello Bon Sangue, LIACS - Leiden University, The Netherlands
Lydie du Bousquet, LIG, France
Mark van den Brand, Technical University of Eindhoven, The Netherlands
Manfred Broy, Institut für Informatik, TU München, Germany
Gerardo Canfora, University of Sannio, Italy
Cinzia Cappiello, Politecnico di Milano, Italy
Antonio Cerone, UNU-IIST, China
Sergio de Cesare, Brunel University, U.K.
W. K. Chan, City University of Hong Kong, Hong Kong
Kung Chen, National Chengchi University, Taiwan
Jinjun Chen, Swinburne University of Technology, Australia
Shipping Chen, CSIRO ICT Centre Australia, Australia
Yoonsik Cheon, University of Texas at El Paso, U.S.A.
Peter Clarke, Florida International University, U.S.A.
Rolland Colette, University Paris I Pantheon Sorbonne, France
Rem Collier, University College Dublin, Ireland
Kendra Cooper, The University of Texas at Dallas, U.S.A.
Alexandra Cristea, University of Warwick, U.K.
Alfredo Cuzzocrea, University of Calabria, Italy
Bogdan Czejdo, Loyola University, U.S.A.
Sergiu Dascalu, University of Nevada Reno, U.S.A.
Mehdi Dastani, Utrecht University, The Netherlands
Steve Demurjian, University of Connecticut, U.S.A.
Giovanni Denaro, University of Milano-Bicocca, Italy
Nikolay Diakov, Fredhopper B.V., The Netherlands
Oscar Díepe, Universidad Politécnica de Madrid, Spain
Jan L. G. Dietz, Delft University of Technology, The Netherlands
Jing Dong, University of Texas at Dallas, U.S.A.
Brian Donnellan, National University of Ireland, Ireland
Juan C. Dueñas, Universidad Politécnica de Madrid, Spain
Philippe Dugerdil, HEG-University of Applied Sciences, Switzerland
Jürgen Ebert, University Koblenz, Germany
Fikret Ercal, Missouri University of Science & Technology, U.S.A.
Yadran Eterovic, P. Universidad Católica de Chile, Chile
Behrouz Far, University of Calgary, Canada
Clever de Farias, University of São Paulo, Brazil
Massimo Felici, The University of Edinburgh, U.K.
Gianluigi Ferrari, University of Parma, Italy
Rudolf Ferenc, University of Szegeds Hungary
Juan Fernandez-Ramil, The Open University, U.K.
Gerald Gannod, Miami University, U.S.A.
Jose M. Garrido, Kennesaw State University, U.S.A.
Maria Jesus Garzaran, University of Illinois at Urbana-Champaign, U.S.A.
Dragan Gasevic, Simon Fraser University, Canada
Nikolaos Georgantas, INRIA Rocquencourt, France
Paola Giannini, Università del Piemonte Orientale, Italy
Paul Gibson, Telecom SudParis, France
Karl Goeschka, Vienna University of Technology, Austria
Swapna Gokhale, University of Connecticut, U.S.A.
Jesus M. Gonzalez-Barahona, Universidad Rey Juan Carlos, Spain
Juan Carlos Granja, University of Granada, Spain
Paul Grefen, Eindhoven University of Technology, The Netherlands
Daniela Grigori, University of Versailles, France
Klaus Grimm, DAIMLER AG, Germany
Yann-Gael Guenneneuc, DIRO - Université de Montréal, Canada
Slimane Hammoudi, ESEO, Angers, France
Jameleddine Hassine, Concordia University, Canada
Reiko Heckel, University of Leicester, U.K.
Christian Heinlein, Aalen University, Germany
Jose Luis Arciniegas Herrera, Universidad del Cauca, Colombia
Rattikorn Hewett, Texas Tech University, U.S.A.
Jang Eui Hong, Chungbuk National University, Korea
Ilian Ilkov, IBM Nederland B.V, The Netherlands
Ivan Ivanov, SUNY Empire State College, U.S.A.
Stephen Jarvis, University of Warwick, U.K.
Damir Kalpic, Faculty of Electrical Engineering and Computing, Croatia
Tuba Yavuz Kahveci, University of Florida, U.S.A.
Krishna Kavi, University of North Texas, U.S.A.
Roger King, University of Colorado, U.S.A.
Alexander Knapp, Ludwig-Maximilians-Universität München, Germany
Mieczyslaw Kokar, Northeastern University, U.S.A.
Jun Kong, North Dakota State University, U.S.A.
Rainer Koschke, University of Bremen, Germany
Jens Krinke, FernUniversität in Hagen, Germany
Padmanabhan Krishnan, Bond University, Australia
Martin Kropp, University of Applied Sciences Northwestern Switzerland, Switzerland
Tei-Wei Kuo, National Taiwan University, Taiwan
Yvan Labiche, Carleton University, Canada
Michele Lanza, University of Lugano, Switzerland
Eitel Lauria, Marist College, U.S.A.
Jonathan Lee, National Central University, Taiwan
Yu Lei, University of Texas at Arlington, U.S.A
Rogerio de Lemos, University of Kent, U.K.
Raimondas Lencevicius, Nokia Research Center, U.S.A.
Hareton Leung, Hong Kong Polytechnic University, Hong Kong
Kuan-Ching Li, Providence University, Taiwan
Man Lin, St. Francis Xavier University, Canada

A number of selected papers presented at ICSOFT 2008 will be published by Springer-Verlag in a CCIS Series book. This selection will be done by the Conference Co-chairs and Program Co-chairs, among the papers actually presented at the conference, based on a rigorous review by the ICSOFT 2008 program committee members.
This volume contains the proceedings of the third *International Conference on Software and Data Technologies (ICSOFT 2008)*, organized by the Institute for Systems and Technologies of Information, Communication and Control (INSTICC) in cooperation with the Interdisciplinary Institute for Collaboration and Research on Enterprise Systems and Technology (IICREST), and co-sponsored by the Workflow Management Coalition (WiMC).

The purpose of this conference is to bring together researchers, engineers and practitioners interested in information technology and software development. The conference tracks are “Programming Languages”, “Software Engineering”, “Distributed and Parallel Systems”, “Information Systems and Data Management” and “Knowledge Engineering”.

Software and data technologies are essential for developing any computer information system, encompassing a large number of research topics and applications: from programming issues to the more abstract theoretical aspects of software engineering; from databases and data-warehouses to management information systems and knowledge-base systems; Distributed systems, ubiquity, data quality and other related topics are included in the scope of ICSOFT.

ICSOFT 2008 received 296 paper submissions from more than 50 countries in all continents. To evaluate each submission, a double blind paper evaluation method was used: each paper was reviewed by at least two internationally known experts from ICSOFT Program Committee. Only 49 papers were selected to be published and presented as full papers, i.e. completed work (8 pages in proceedings / 30’ oral presentations), 70 additional papers, describing work-in-progress, were accepted as short paper for 20’ oral presentation, leading to a total of 119 oral paper presentations. There were also 40 papers selected for poster presentation. The full-paper acceptance ratio was thus 16%, and the total oral paper acceptance ratio was 40%.

In its program ICSOFT includes panels to discuss aspects of software development, with the participation of distinguished world-class researchers; furthermore, the program is enriched by several keynote lectures delivered by renowned experts in their areas of knowledge. These high points in the conference program definitely contribute to reinforce the overall quality of the ICSOFT conference, which aims at becoming one of the most prestigious yearly events in its area.

The program for this conference required the dedicated effort of many people. Firstly, we must thank the authors, whose research and development efforts are recorded here. Secondly, we thank the members of the program committee and the additional reviewers for their diligence and expert reviewing. I would like to personally thank the Program Chairs, namely Boris Shishkov and Markus Helfert, for their important collaboration. The local organizers and the secretariat have worked hard to provide smooth logistics and a friendly environment, so we must thank them all and especially Ms. Monica Saramago for their patience and diligence in answering many emails and solving all the problems. Last but not least, we thank the invited speakers for their invaluable contribution and for taking the time to synthesize and prepare their talks.
A successful conference involves more than paper presentations; it is also a meeting place, where ideas about new research projects and other ventures are discussed and debated. Therefore, a social event including a conference diner was organized for the evening of July 7 (Monday) in order to promote this kind of social networking.

We wish you all an exciting conference and an unforgettable stay in the cosmopolitan city of Porto. We hope to meet you again next year for the 4th ICSoft, to be held in the charming city of Sofia (Bulgaria), details of which will be shortly made available at http://www.icsoft.org.

## CONTENTS

### INVITED SPEAKERS

**Tutorial**

CRYPTOGRAPHIC FEATURES, APPLICATIONS: JAVA (C)

*Ray Kresma*

**Keynote Lectures**

SEARCH-DRIVEN SOFTWARE ENGINEERING

*Colin Atkinson*

USER DEFINED GEO-REFERENCED INFORMATION MANAGEMENT

*Dimitri Konstantas*

WHAT’S IN A SERVICE?

*Michael Papazoglou*

SERVICE-ORIENTED MODELING AND SIMULATION - Applications in Traffic Management

*Alexander Verbraeck*

### SOFTWARE ENGINEERING

**Full Papers**

VERIFICATION OF SCENARIOS USING THE COMMON CRITERIA

*Atsushi Ohnishi*  

FROM UML TO ANSI-C - An Eclipse-based Code Generation Framework

*Mathias Funk, Alexander Nyßen and Horst Lichter*  

EMPIRICAL ASSESSMENT OF EXECUTION TRACE SEGMENTATION IN REVERSE-ENGINEERING

*Philippe Dugerdil and Sebastien Jossi*  

RESOURCE SUBSTITUTION WITH COMPONENTS - Optimizing Energy Consumption

*Christian Bunse and Hagen Hüpffer*  

USER GUIDANCE OF RESOURCE-ADAPTIVE SYSTEMS

*João Pedro Souza, Rajesh Krishna Balan, Vabe Poludian, David Garlan and Mahadev Satyanarayanan*  

FAULTS ANALYSIS IN DISTRIBUTED SYSTEMS - Quantitative Estimation of Reliability and Resource Requirements

*Christian Dauer Thorenfeldt Sellberg, Michael R. Hansen and Paul Fischer*  

DESIGN ACTIVITIES FOR SUPPORTING THE EVOLUTION OF SERVICE-ORIENTED ARCHITECTURE

*Dionisis X. Adamopoulos*  

ORACLE SECUREILES - A Filesystem Architecture in Oracle Database Server

*Nilesh Mukherjee, Amit Ganesh, Krishna Kuchithapadam and Sujatha Mathurungam*
QUALITY AND VALUE ANALYSIS OF SOFTWARE PRODUCT LINE ARCHITECTURES
Liliana Dobrica and Eila Niemela

ON THE CLARIFICATION OF THE SEMANTICS OF THE EXTEND RELATIONSHIP IN USE CASE MODELS
Miguel A. Laguna and José M. Marqués

ANALYZING IMPACT OF INTERFACE IMPLEMENTATION EFFORTS ON THE STRUCTURE OF A SOFTWARE MARKET - OSS/BSS Market Polarization Scenario
Oleksiy Mazhelis, Pasi Tyrväinen and Jarmo Matilainen

LOCALIZING BUGS IN PROGRAMS - Or How to Use a Program’s Constraint Representation for Software Debugging?
Franz Wotawa

IMPROVING THE SECURITY OF MOBILE-PHONE ACCESS TO REMOTE PERSONAL COMPUTERS
Alireza P. Sabzevar and João Pedro Sousa

VISUAL ABSTRACT NOTATION FOR GUI MODELLING AND TESTING - VAN4GUIM
Rodrigo M. L. M. Moreira and Ana C. R. Paiva

SHORT PAPERS

ELUSIVE BUGS, BOUNDED EXHAUSTIVE TESTING AND INCOMPLETE ORACLES
W. E. Howden

TOWARDS A CLASSIFICATION SCHEME IN ORTHOGONAL DIMENSIONS OF REUSABILITY
Markus Aulkemeier, Jürgen Heine, Emilio G. Roselló, Jacinto G. Davosta and J. Baltasar Garcia Perez-Scholfield

ADJUSTING ANALOGY SOFTWARE EFFORT ESTIMATION BASED ON FUZZY LOGIC
Mohammad Azzeh, Daniel Neagu and Peter Cowling

RAPID APPLICATION DEVELOPMENT IN SYNERGY WITH PERSISTENCE FRAMEWORK
Choon How Choo and Sai Peck Lee

FUNCTION POINT SIZE ESTIMATION FOR OBJECT ORIENTED SOFTWARE BASED ON USE CASE MODEL
A. Chamundeswari and Chitra Babu

ENGINEERING PROCESS BASED ON GRID USE CASES FOR MOBILE GRID SYSTEMS
David G. Rosado, Eduardo Fernández-Medina, Mario Piattini and Javier López

RESOLVING INCOMPATIBILITY DURING THE EVOLUTION OF WEB SERVICES WITH MESSAGE CONVERSION
Vadym Borovskiy, Alexander Zeier, Jan Karstens and Heinz Ulrich Raggenbemper

FINE-GRAINED INTEGRATED MANAGEMENT OF SOFTWARE CONFIGURATIONS AND TRACEABILITY RELATIONS
Pietro Colombo, Vieri del Bianco and Luigi Larrazza

AN INCREMENTAL APPROACH TO SOFTWARE REENGINEERING BASED ON OBJECT-DATA MAPPING
Giacomo Bucci, Valeriano Sandracci and Enrico Vicario

A COMPONENT-BASED SOFTWARE ARCHITECTURE - Reconfigurable Software for Ambient Intelligent Networked Services Environments
Michael Berger, Lars Dittmann, Michael Carageziadis, Nikos Mouratidis, Christoforos Kavadias and Michael Loupis
STRUCTURING DESIGN KNOWLEDGE IN SERVICE-ORIENTED ARCHITECTURE
Dionisis X. Adamopoulos 180

LASER SIMULATION - Methods of Pulse Detection in Laser Simulation
Jana Hájková 186

HANDLING DEVELOPMENT TIME UNCERTAINTY IN AGILE RELEASE PLANNING
Kevin Logue and Kevin McDaid 192

GOOAL AUTOMATIC DESIGN TOOL - A Role Posets based Tool to Produce Object Models from Problem Descriptions
Hector G. Perez-Gonzalez, Sandra Nava-Muñoz, Alberto Nuñez-Varela and Jugal Kalita 200

AUTOMATIC GENERATION OF INTERACTIVE PROTOTYPES FOR DOMAIN MODEL VALIDATION
António Miguel Rosado da Cruz and João Pascoal Faria 206

DYNAMISM IN REFACTORING CONSTRUCTION AND EVOLUTION - A Solution based on XML and Reflection
Raúl Marticorena and Yanira Crespo 214

MODELS FOR INTERACTION, INTEGRATION AND EVOLUTION OF PRE-EXISTENT SYSTEMS AT ARCHITECTURAL LEVEL

AN ESTIMATIVE MODEL OF THE POINTED DEFECTS RATE IN SOFTWARE PRE-REVIEW FOR NOVICE ENGINEERS IN CHINESE OFFSHORE COMPANY
Zuoqi Wang, Yixiao Qu, Masanori Akiyoshi and Norihisa Komoda 228

A UML-BASED VARIABILITY SPECIFICATION FOR PRODUCT LINE ARCHITECTURE VIEWS
Liliana Dobrica and Eila Niemela 234

A HW/SW CO-REUSE METHODOLOGY BASED ON DESIGN REFINEMENT TEMPLATES IN UML DIAGRAMS
Masahiro Fujita, Takeshi Matsumoto and Hirunuki Yoshida 240

RIGOROUS COMMUNICATION MODELLING AT TRANSACTION LEVEL WITH SYSTEMC
Tomi Metsälä, Tomi Westerlund, Seppo Virtanen and Juha Plosila 246

PATTERN-BASED BUSINESS-DRIVEN ANALYSIS AND DESIGN OF SERVICE ARCHITECTURES
Verónica Gacitúa-Decar and Claus Pahl 252

POSTERS

LEARNABILITY AND ROBUSTNESS OF USER INTERFACES - Towards a Formal Analysis of Usability Design Principles
Steinar Kristoffersen 261

SOFTWARE RE-STRUCTURING - An Architecture-Based Tool
Violeta Bozhkova, Mariana Stoica, Anatoly Antonov and Vladimir Nikolov 269

SOFTWARE EFFORT ESTIMATION AS A CLASSIFICATION PROBLEM
Ayşe Baskı, Burak Turban and Ayşe Bener 274
AN INTERMEDIATION SYSTEM BASED ON AGENTS MODELLING TO SHARE KNOWLEDGE IN A COMMUNITY OF PRACTICES
Claudex Kenfack and Danielle Boulanger

PREDICTING DEFECTS IN A LARGE TELECOMMUNICATION SYSTEM
Gözde Koçak, Burak Turhan and Ayşe Bener

REFACTORING PREDICTION USING CLASS COMPLEXITY METRICS
Yasemin Köşker, Burak Turhan and Ayşe Bener

MODELS, FEATURES AND ALGEBRAS - An Exploratory Study of Model Composition and Software Product Lines
Roberto E. Lopez-Herrejon

SPECIAL SESSION ON METAMODELLING – UTILIZATION IN SOFTWARE ENGINEERING

INVITED PAPER

CONNECTORS IN A MULTI-LEVEL MODELING ENVIRONMENT
Colin Atkinson

PAPERS

SUPPORTING SOFTWARE PROCESS MEASUREMENT BY USING METAMODELS - A DSL and a Framework
Beatriz Mora, Felix Garcia, Francisco Ruiz and Mario Piattini

MATHS VS (META)MODELLING - Are we Reinventing the Wheel?
Klaus McDonald-Maier, David Akehurst, B. Bordbar and Gareth Howells

JOINING SOFTWARE TECHNOLOGIES - A Model Driven Approach for Interactive Groupware Application Development
William Joseph Giraldo, Ana Isabel Molina, Manuel Ortega Cantero and Cesar Alberto Collazos

INTEGRATING SEMANTIC ALGEBRA IN THE MDA FRAMEWORK
Paulo E. S. Barbosa, Franklin Ramalho, Jorge C. A. de Figueiredo and Antonio D. dos S. Junior

SPECIAL SESSION ON GLOBAL SOFTWARE DEVELOPMENT: CHALLENGES AND ADVANCES

MERLIN COLLABORATION HANDBOOK - Challenges and Solutions in Global Collaborative Product Development
Päivi Parviainen, Juho Eskeli, Tanja Kyynkänniemi and Maarit Tihinen

COMPETENCIES DESIRABLE FOR A REQUIREMENTS ELICITATION SPECIALIST IN A GLOBAL SOFTWARE DEVELOPMENT
Miguel Romero, Aurora Vizquino and Mario Piattini

EVALUATING FACTORS THAT CHALLENGE GLOBAL SOFTWARE DEVELOPMENT
Gabriela N. Aranda, Aurora Vizquino, Ahjumdra Cebiib and Mario Piattini

AUTHOR INDEX
Abstract: The interest to incorporate mobile devices into Grid systems has arisen with two main purposes. The first one is to enrich users of these devices while the other is that of enriching the own Grid infrastructure. Security of these systems, due to their distributed and open nature, is considered a topic of great interest. A formal approach to security in the software life cycle is essential to protect corporate resources. However, little attention has been paid to this aspect of software development. Due to its criticality, security should be integrated as a formal approach into the software life cycle. We are developing a methodology of development for secure mobile Grid computing based systems that helps to design and build secure Grid systems with support for mobile devices directed by use cases and security use cases and focused on service-oriented security architecture. In this paper, we will present one of the first steps of our methodology consisting of analyzing security requirements of mobile grid systems. This analysis will allow us to obtain a set of security requirements that our methodology must cover and implement.

1 INTRODUCTION

Grid computing is already a mainstream paradigm for resource-intensive scientific applications, but it also promises to become the future model for enterprise applications. The grid enables resource sharing and dynamic allocation of computational resources, thus increasing access to distributed data, promoting operational flexibility and collaboration, and allowing service providers to scale efficiently to meet variable demands (Foster and Kesselman, 1999).

Today, the development of wireless technology and mobile devices enables us to access the network service from anywhere at any time (Bruneo, Scarpa et al., 2003). Provided that mobile devices have limited computing capacity, the Grid becomes an important computation service provider that enables mobile users to perform complicated jobs (Trung, Moon et al., 2005). On the other hand, the performances of current mobile devices have significantly increased, reason why laptops and PDAs can provide aggregated computational capability when gathered in hotspots, forming a Grid on site. Mobile Grid, in relevance to both Grid and Mobile Computing, is a full inheritor of Grid with the additional feature of supporting mobile users and resources in a seamless, transparent, secure and efficient way (Litke, Skoutas et al., 2004; Guan, Zaluska et al., 2005; Jameel, Kalim et al., 2005).

Security has been a central issue in grid computing from the outset, and has been regarded as the most significant challenge for grid computing (Humphrey, Thompson et al., 2005). Security over the mobile platform is more critical due to the open nature of wireless networks. In addition, security is more difficult to implement into a mobile platform due to the limitations of resources in these devices (Bradford, Grizzell et al., 2007). Therefore, a Grid infrastructure that supports the participation of mobile nodes will play a significant role in the development of Grid computing.
A Grid system is a software that has been developed by means of a certain technology and that fulfills a set of characteristics and own functionalities of the Grid. As it is a software, the problems that have arisen and given rise to numerous researches in the last years are those of considering and integrating security into the whole software lifecycle (Baskerville, 1993; Anderson, 2001). In addition, if we add the appearance of a new technology where security is fundamental and the advance that mobile computation has experienced in the last years, it appears the need to define, consider and develop a methodology or process of development in which security is integrated from the first stages of development, obtaining as a result, a secure, robust and scalable Mobile Grid system.

In this paper we want to describe a development process directed by special use cases for mobile grid systems that will help us to identify the necessities and requirements of these environments from initial states and that they will guide us toward the construction of secure service oriented architecture supporting mobile devices and offering security grid services. This methodology has two (general and security) reusable repositories containing artefacts, elements, diagrams of use cases, mechanisms, patterns, templates, and so on, both general and security aspects, that we can use in any stages or activities of our methodology making the development easier.

The rest of paper is organized as follows: In section 2, we will show an overview of our development methodology for secure mobile grid systems. Section 3 will present the main contribution of the paper, which is the analysis process of our methodology of development. We will explain the analysis stage and we will describe in detail one of the activities of this analysis stage, the activity of building security use cases. We will finish by putting forward our conclusions as well as some research lines for our future work in section 4.

2 METHODOLOGY OF DEVELOPMENT

Our objective is to provide developers with firstly, a methodology or development systematic process that will include the complete development of Mobile Grid systems of whatever complexity and magnitude, and secondly, an architecture that helps them to develop a secure mobile Grid system in an ordered and systematic way. The systematic process that we have developed is an iterative, incremental and reusable process. This methodology has been modified and improved with regard to a first approach (Rosado, Fernández-Medina et al., 2008), and it will consist of 3 phases (see Figure 1): planning, development and maintenance of a secure mobile Grid system. In all of them we use elements of the repositories for completing each phase or stage. We briefly describe the phases of our methodology emphasizing the features of mobile grid that are necessary in each phase:

![Figure 1: Methodology of development for secure mobile grid systems.](image-url)

The planning phase is composed of the Secure Mobile Grid System Planning stage, where it is important to understand exactly which components of the grid must be rigorously secured to detect any kind of attack. Technology considerations are important in deploying a grid and it is essential to understand how the departments within an organization interact, operate, and contribute to the whole.

The development phase is composed of three stages: analysis, design and construction.

- **The Secure Mobile Grid System Analysis stage** is centred in building diagrams of use cases and security use cases of our system identifying and analyzing requirements and security requirements of our systems to build. These use cases must be defined for mobile grid applications (stereotypes, constraints, relations, behaviour, etc.). This stage will be described in detail in section 3.
- **In the Secure Mobile Grid System Design stage**, we must build a security architecture offering the necessary security services that fulfill and cover the security requirements identified in the previous stage. This architecture will be a service-oriented architecture where we define a collection of basic security services.
supporting the security requirements of mobile devices in Grid environments. Moreover, we need to identify what security mechanisms, protocols and policies will be used for designing the basic security services.

- In the Secure Mobile Grid System Construction stage, we must implement the basic security services together with security mechanisms and protocols for our secure service-oriented architecture. We must study the Grid Security Infrastructure (GSI) that provides methods for authentication of Grid users and secure communication. It is based on SSL (Secure Sockets Layer), PKI (Public Key Infrastructure) and X.509 Certificate Architecture. The system to be developed is composed of mobile devices and resources which altogether set up a mobile grid system. The wireless technology will be essential for the communication between devices.

The maintenance phase is composed of the Secure Mobile Grid System Maintenance stage, where a plan of maintenance of the system for its later modification is defined according to the new necessities of the client. If a new organization wants to take part of system, or if someone wants to add or to eliminate resources of Grid, the viability of the proposed change must be studied identifying which part of the system is affected and who must take part in its correction, being this change able to be accepted or denied depending on the reach of it.

3 SECURE MOBILE GRID SYSTEM ANALYSIS STAGE

In this section, we will analyze the most common security requirements and challenges associated with the above-defined mobile grids. Applications and their requirements should be analyzed to understand how they could be designed and developed to reap the benefits of a mobile grid. We propose an analysis stage oriented by Grid use cases which are special use cases (stereotypes) where we define constraints and properties that are necessary to define when we are working with mobile devices in Grid environments. This analysis stage will use a reuse repository where diagrams of Grid use cases for Grid applications (CPU intensive, data intensive, collaborative, and so on) are defined and prepared to be used in the design of the diagram of use cases for any mobile Grid application. We define six types: <<Grid: sch>> indicating that the use case belong to the scheduler package; <<Grid: res>> indicating that the use case belong to the resource package; <<Grid: data>> indicating that the use case belong to the data package; <<Grid: manage>> indicating that the use case belong to the management package; <<Grid: secur>> indicating that the use case belong to the security package; and <<Grid: info>> indicating that the use case belong to the information package. The relations between use cases are defined in the repository and we can add new relations or add new actors or constraints for building our own diagram for our application.

This stage analyzes security requirements through grid use cases that we must build for our application using the diagrams of grid use cases of the repository and defining the interfaces and relations between use cases until a full diagram of grid use cases for our application is built. We will describe the analysis stage in a general way and we will study in depth one of the activities of this stage related to the analysis of security requirements that will be explained in the following subsection. Now we will explain the most important (see Figure 2):

![Figure 2: Activities of the Secure Mobile Grid System Analysis stage](image)

- **Definition of Mobile Grid Use Cases (MGUC).** The purpose of this activity is to build a diagram of use cases where we can identify the necessities and requirements of both users and the mobile Grid environment.

- **Mobile Grid System Requirements Analysis.** It specifies both functional and non-functional (excluding security) requirements from MGUC. Also, it specifies security requirements from MGSUC and integrates them into a specification of requirements of the final application.

- **Validation and Verification of Results.** During the course of some designs, requirements can change at the last minute or may go undiscovered. This activity validates the results obtained from the analysis as well as approves the analysis of the system.

Once we have described the activities of the analysis stage, we will explain activity 3, which is in
charge of defining security use cases for the mobile grid system.

3.1 Definition of Mobile Grid Security Use Cases (MGSUC)

The analysis stage of our methodology has a set of activities (see Figure 2) analyzing the requirements of mobile grid systems. One of them (activity 3) is devoted to define and build a diagram of security use cases that will serve to specify the security requirements for this kind of systems. A study of security requirements in the analysis stage is necessary for building a secure system, identifying and analyzing security from early stages of life cycle. Once the diagram is built, we can formally specify the security requirements that we can extract from the security use cases. A set of tasks will serve us as a guide for defining and building the security use cases and misuse cases for mobile grid systems:

3.1.1 Identify Security Assets: Task 3.1

The security assets for a grid with mobile devices depend on the characteristics and type of system to build, but the most important assets to protect will be exchanged data, resources of each participant organization, communication between mobile devices and the grid, and personal information. The CPU-intensive applications will consider resources as main assets while data-intensive applications will consider data as main assets to protect.

3.1.2 Identify Threats, Vulnerabilities and Risks: Task 3.2

We can consider the security threats related to any open network and others related to the mobile communications. The security threats that are usually present in the mobile and open networks are the following: eavesdropping, communication jamming, injection and modification of data, interruption, unauthorized access, repudiation, shoulder surfing, lost mobile terminal, stolen mobile terminal, unprepared communication shutdown, misreading and input error. The most important security attacks for Grid are as follows: user credentials attacks, man in the middle, credentials compromise and/or replay, session hijack, SOAP routing detour, attributes/credentials probing and brute force attacks, improper key and privileges management and control, etc.

In the security repository there are a set of threats, vulnerabilities and risks either identified from the beginning or that have been added during the development. These vulnerabilities and risks are well-known for mobile computing and Grid computing. If there are new threats for this application, we must define them and update the repository with these new threats extending and improving the security repository for future developments.

3.1.3 Build Diagrams of Security Use Cases and Misuse Cases: Task 3.3

Once we have identified the threats and vulnerabilities for Grid environments and mobile computation, we can build, using security use cases and misuse cases, a diagram of mobile Grid security use cases where threats, attacks and security are expressed and represented in the diagram indicating the assets to protect, the security objectives to achieve and the security requirements that the system must fulfill.

In this task, we can use artifacts from our security repository such as reference diagrams of security use cases and misuse cases for Mobile Grid system that have been built in initial phases of development or updated in several activities and tasks of our methodology. These reference diagrams are general diagrams for any mobile Grid application therefore, we must adapt them to our necessities modifying, adding or deleting relations, constraints and security cases until obtaining a diagram of security use cases for our application that serves for specifying security requirements in next tasks or activities of this stage.

In figure 3, we can see the general diagram for Mobile Grid security use cases with the external
actors implicated and the security use cases that we believe fundamental. Based on this information, we use the use cases and their relations and constraints for building our diagram of security use cases covering the initial necessities and requirements, and the resultant diagram integrates them into the final diagram of use cases for the secure mobile Grid application.

3.1.4 Assessment of Security (Threats, Risks and Countermeasures): Task 3.4

It is necessary to assess whether the threats are relevant according to the security level specified by the security objectives. Then, we have to estimate the security risks based on the relevant threats, their likelihood and their potential negative impacts, in other words, we have to estimate the impact (what may happen) and risk (what will probably happen) which the assets in the system are exposed to. We have to interpret the meaning of impact and risk. In order to carry out this task, we will use a technique proposed by the guide of techniques of MAGERIT (MAP, 2006) and which is based on tables to analyze impact and risk of threats.

For example, if an alteration of information occurs, we must analyze if the information that has been modified implies low impact and risk, or on the contrary it implies high impact and risk.

3.2 Analysis/Integration of Mobile Grid Systems Requirements

This activity will have as result a security requirements specification for our application and they have been obtained from use cases and security use cases that we have build using components and models of repositories (general and security) where we can update and add with news elements that we believe important for future developments of this kind of applications. So, for example, we must obtain a set of security requirements that will be some of the most important security requirements and challenges associated with grids and mobile computing (ITU, 2004; Trusted Computing Group Administration, 2006; Vivas, López et al., 2007): Authentication, Confidentiality, Integrity, Authorization and access control, Trust, Single sign-on, privilege delegation, Non-repudiation, interoperability, Usability, Availability, and so on.

All these factors are at play in the Grid, wireless and mobile device world. There are many shared security requirements both grid environments and mobile computing, and there are others one that are exclusives and depend of our application, depending of the point of view that we consider (see Table 1).

Table 1: Security requirements from several points of view.

</table>

We have the purpose of developing and building a secure mobile grid system, we must consider these security factors within our methodology, identifying and analyzing them in the analysis stage, which will be shown below, extracting them from the security use cases and integrating security mechanisms, protocols and policies into our security architecture that covers all these requirements. ITU_T X.800 Recommendation provides not only a general description of security services but also the related mechanisms that may be used to provide these services. These services will be the security services of our service-oriented architecture (design stage of our methodology) where are well-defined obtaining a reference security architecture that offers security services to mobile users aimed at using grid services sharing and coordinating mobile resources for all members of the Grid.

4 CONCLUSIONS

In mobile environments the context is extremely dynamic and it cannot be managed by a priori assumptions. A methodology is necessary to build this mobile software incorporating security from the first phases of the life cycle obtaining a secure
mobile grid system. It is difficult to incorporate safely existing mobile devices into the Grid, so that the impact is minimum and transparent to the user. That’s the reason why the necessity to elaborate and define a process of development of a system based on the Grid and mobile technology and, considering the peculiarities and necessities of this type of systems arises. This process must be always flexible, scalable and dynamic, so that it adapts itself to the necessities, always changing, of the mobile Grid systems.

An important phase of the methodology is the security requirements analysis which we have proposed with a set of task identifying assets to protect, threat and vulnerabilities of our application and building a diagram of security use cases and misuse cases from which we can specify security requirements for our application in next stages of our methodology. These security requirements must be analyzed, specified and validated ensuring that all requirements obtained are complete, consistent and easily understandable and analyzable by the different actors involved in the development.

As a future work we will analyze in depth the proposed methodology making a special effort in describing each stage in detail and applying all the stages to a case study to obtain a real mobile grid system. Also, we will complete our initial repositories with all use cases and security use cases, relations, constraints, actors, and any other information important and we will specify them formally.
